

FOOD GRADE LUBRICANTS

reinhard oil

w.ReinhardOil.dk - T: 70267007

Matrix Specialty Lubricants

Matrix Specialty Lubricants is a company based in The Netherlands, producing and marketing specialty lubricants and greases.

Matrix Specialty Lubricants was created by a nucleus of industry specialists with a collective experience of many years working for major oil companies. Our vision is to harness new technology and with the expertise of our chemists provide the correct lubricant for each application. It is just a matter of knowledge.

Specific product information is available in our brochures and most of the technical data sheets can be found on our website; www.lubes-portal.com. Our main products are divided into groups with the most common being presented in our brochures. The most up to date information can always be found on our website.

Bio lubricants

This group of products includes biodegradable hydraulic, gear, and other lubricants as well as a range of greases and concrete release agents. High performance, long life, low toxicity and biodegradability are key factors within this product group.

Compressor, vacuum and refrigeration fluids

A comprehensive range of gas and refrigeration compressor fluids providing long life and low maintenance costs in combination with high efficiency. The range consists of mineral, and synthetic (hydro treated, PAO, POE, Alkyl Benzenes, Di-Ester, Ester, PAG, PFPE) based lubricants with a performance up to 12.000 hour drain intervals.

Food grade lubricants

A complete range of fluids, lubricants and greases for applications whenever a food grade lubricant is required. The high performance Foodmax® line is NSF and InS approved and includes a range of spray cans.

Industrial specialty products

This product group includes a range of specialty chain lubricants, gear oils, transformer oils and many more products. All the products exceed performance expectations contributing to lower maintenance costs.

Grease and paste

An extensive range of specialty greases and pastes, including polyurea, calcium sulphonate, aluminium, barium, silicon, inorganic and PFPE. By using the latest technology and materials we are able to provide high performance and problem solving products.

Specialty base oils and dispersions

These base oils are used in the formulation of metalworking fluids, biodegradable hydraulic fluids, top tier 2 stroke engine oils, mould release agents and many more. They include DTO, TOFA and various types of esters. Another range include both technical and pharmaceutical white oils.

The Matrix line of D-MAX colloidal dispersions contain products based on graphite, MoS₂, PTFE and Boron Nitride (hBn). These can be used as additives, lubricants and processing products.

Food grade lubricants

The food processing industry presents unique challenges to lubricant formulation engineers, lubricant marketers, plant lubrication engineers and equipment designers. It is never desirable for lubricants to be allowed to contaminate raw materials, work-in-progress or finished product, the consequences of a lubricant contaminated product are rarely more acute than in the food processing industry. As such, lubricants used in this industry have requirements, protocols and performance expectations that exceed typical industrial lubricants.

Matrix Specialty Lubricants has developed an extensive range of food grade lubricants which frequently outperform high tech industrial lubricants and greases. Matrix continues to develop and add new products to the existing extensive portfolio. For any special product request do not hesitate to seek the assistance of your local Matrix representative.

NSF and InS are certification bodies which approve lubricants and greases according to various categories. In the overview below you will find an explanation of the most common lubricant approvals.

H-1 Lubricants

Universally applied in applications where incidental contact with food products is likely

HX-1 Lubricants

Use in lubricants with incidental food contact

H-2 Lubricants

Used on operating equipment that is vital to the manufacturing plant, but will not come in contact with food products. Will not contain: Perfume, Pb, Sb, Cd or Ni additives

HT-1 Heat Transfer Fluids

Universally applied in applications where incidental contact with food products is likely

H-3 Soluble Oils

These products are chemically acceptable for applications to hooks, trolleys and similar equipment to clean and prevent rust. Those portions of the equipment that contact edible products must be made free of the mixture before re-use

3-H Release Agents

Lubricants and release agents that will often come in contact with food. Unlike H-1, 3-H lubricants can be used as food additives (the 10 PPM rule does not apply) (i.e. divider oil)

General lubricants

The lubrication of numerous lubrication points found in the food industry.

Hydraulic lubricants

A large proportion of equipment in the food processing industry is operated by hydraulic systems. Although hydraulic systems are used relatively far from the process, the risk of contamination is large because the high operating pressures can cause leakages to travel a long distance. has developed 3 types of food grade hydraulic fluids to suit specific performance requirements.

Foodmax® Basic

Paraffin food grade oil for general lubrication purposes. Can be used in authorized industrial operations wherever there is the possibility of food contact (for both humans or animals). Foodmax® Basic can be used as a general lubricant in various applications in the food processing industry. Additionally it gives excellent results as general lubricant in the textile, knitwear, food and tin container industry, whenever very high cleanliness level is required.

Foodmax® AW

Foodmax® AW is non toxic and formulated using specially selected highly refined base stocks in combination with the latest additive technology. Foodmax® AW is suitable for applications where incidental contact with food or raw materials is possible during the production process. Due to the very low pour point Foodmax® AW PAO is better suited to low temperature applications in comparison to Foodmax® AW. Foodmax® AW 22 is a higher performance alternative to soap/water mixtures for the lubrication of conveyor belts in the beverage industry.

Foodmax® AW PAO

Foodmax® AW PAO is non toxic and formulated using specially selected synthetic base stocks in combination with the latest additive technology. Foodmax® AW PAO is suitable for applications where incidental contact with food or raw materials is possible during production. Because of its great performance characteristics and carefully chosen additives, Foodmax® AW PAO oils can be used in most applications in the food manufacturing and processing industry.

Foodmax® FRF

Foodmax® FRF is a synthetic food grade fire resistant hydraulic fluid formulated to provide both fire resistance and excellent lubrication. Unlike most water glycol based formulations, Foodmax® FRF is easy to maintain, has an exceptionally long fluid life and offers superior pump protection. No special change out procedures are necessary to switch from a standard mineral oil hydraulic fluid to Foodmax® FRF and, unlike water glycol formulations, pump deration is not required. Its' exceptional oxidative stability, corrosion resistance, and anti-wear properties make Foodmax® FRF particularly well suited for applications where other fire resistant fluid technologies are restricted. Check out the demonstration video on YouTube or our website searching for Foodmax® FRF.

Gear lubricants

Gearboxes are seen everywhere in food processing plants. Most of the time they are relatively small and will operate at both low and high temperatures. Depending on the circumstances and type of gearbox the right choice can be made from Foodmax® Gear, Gear PAO or Gear PAG.

Compressor & Vacuum pump

Compressed air and vacuum pumps are vital components in any food production or processing plant. Cleanliness of the equipment, temperature resistance and lifetime of the lubricant can influence the reliability of compressors and vacuum pumps to a great extent.

Foodmax® Gear

Food grade range of lubricants for gears, bearings and transmissions
Foodmax® Gear is a range of lubricants in which a combination of the latest base stock technology together with special additives delivers a very high performance. All base material used for the formulation is non-toxic and food grade. Also suitable as chain oil when a non sticky lubricant is required.

Foodmax® Gear PAO

Range of fully synthetic food grade gear oils, particularly suited for the lubrication of drive chains, conveyor chains, gearboxes and reduction units. Foodmax® Gear PAO 680-1000 contains special additives that extend relubrication intervals. These lubricants can also be used as chain oils. Foodmax® Gear PAO is specially designed for low temperature applications.

Foodmax® Gear PAG

Foodmax® Gear PAG is a synthetic oil with excellent anti wear properties, high stability to oxidation and a low pour point. It is neutral to metals including aluminum alloys and copper. It resists mechanical shearing, is very stable to ageing and has very good viscosity temperature characteristics. Foodmax® Gear PAG is suitable for the most severely loaded gearboxes. Foodmax® Gear PAG is not miscible with other synthetic and mineral fluids.

Foodmax® Air

The superior performance characteristics of Foodmax® Air mean it can be used safely in all types of compressors and vacuum pumps. The product is based on a fully synthetic base oil and specially selected additives. Foodmax® Air has an excellent oxidation stability and long life at very high temperatures. Foodmax® Air 32 can be used as an airline lubricant.

Foodmax® Air PAO

Foodmax® Air PAO oils are food grade, non-toxic synthetic oils developed for all types of compressors used in the food, beverage and pharmaceutical industries.

Foodmax® selection table

Chain & Conveyors lubricants

Food is very often transported in a food production plant using chains and conveyors. As these chains are exposed to water, cleaning agents and extreme temperature variations it is extremely important to select the right product.

Foodmax® Chain

Fully synthetic food grade oil with characteristics that make it particularly suited for the lubrication of drive chains and conveyor chains, gearboxes and reduction units. Contains special additives that extend relubrication intervals significantly; and does not contain any mineral components. Foodmax® Chain can be used in incidental contact with food and raw materials.

Foodmax® Chain LT

Foodmax® Chain LT is based on a blend of synthetic hydrocarbons and is inhibited against oxidation to give a long wet film life over a wide temperature range.

Foodmax® Chain LT is designed for the lubrication of conveyor chains and bearings running continuously at low temperatures, down to minimum of – 40 °C. Foodmax® Chain LT is also suitable for spiral freezers.

Foodmax® Chain HT

Foodmax® Chain HT is based on highly polar biodegradable base oil and is inhibited against oxidation to give a long wet film life at high temperatures. The highly polar molecules strongly adhere to the surface and withstand high temperatures, at the same time separating the moving parts thanks to its highly viscous lubricating film which is maintained at these high temperatures. Foodmax® Chain HT can resist up to 250°C, and is therefore suitable for bread ovens in bakeries.

Foodmax® Mammut Oil 25

Foodmax® Mammut Oil 25 is a food grade product formulated to dissolve sugar from chains, slides and moulds. It has been developed specially for the confectionary market and any application involving sugar. Foodmax® Mammut oil 25 washes sugar off before lubricating and protecting the chain.

Foodmax® Chain selection table

Foodmax® Chain 	Temp. range °C								ISO VG	Kinematic Viscosity 40 °C	Kinematic Viscosity 100 °C	VI	Pour Point °C	Flash Point °C	4-ball wear test	
	-45	-30	-15	0	50	100	150	250							Welding load, kg	Wear scar dm, 40 kg, 1 hr, mm

Foodmax® Mammut Oil 25									25	25			-20	>100		

Greases

The use of grease in the food production process is almost endless. This in combination to wet environments, excessive cleaning with chemicals and extreme temperature variations makes choosing the right grease of major importance. In the past, food grade greases were developed to be non toxic and provided minimum performance. The latest generation of Matrix calcium sulphonate food grade greases however are outperforming most high tech industrial grades.

Many happy customers report that the performance of these greases are almost too good to be food grade.

Foodmax® Grease ALU-M

Foodmax® Grease ALU-M is a range of HT-base oil aluminum complex greases designed for the lubrication of almost any application which requires a food grade lubricant. The Foodmax® Grease ALU-M series are formulated with complex soap, additive package and authorized solid lubricants. They possess excellent lubricating properties and a high water resistance, perfect when a combination of water and high load resistance is required. Foodmax® Grease ALU-M series can be used in a large variety of applications including bearings operating within a temperature range of -35 to 150 °C. The speed factor is approx 5 x 105 in the presence of high loads and water.

Foodmax® Grease ASP

Foodmax® Grease ASP 2 is an aluminum complex grease designed for the lubrication of almost any type of application which requires a food grade lubricant. Foodmax® Grease ASP 2 is formulated with a complex soap, synthetic base oil, additive package and solid lubricants. Thanks to the superior resistance to water ASP 2 is very suitable for the lubrication of chains operated in very wet conditions such as food conveyor chains. Foodmax® Grease ASP can resist higher temperatures and loads in comparison to Foodmax® Grease ALU-M.

Foodmax® Grease CAS M2

Foodmax® Grease CAS M 2 is a member of a family of technologically advanced greases which have been developed by complexing modified overbased calcium sulfonates. This technology is characterized by exceptional mechanical stability, high dropping point, high load carrying performance, reduced wear and excellent resistance to water and corrosion. This technology equals and, in many ways, outperforms other premium, high temperature greases such as lithium complex and aluminum complex.

Foodmax® Grease CAS S LS

Foodmax® Grease CAS S 1 LS is a member of a family of technologically advanced greases which have been developed by complexing modified overbased calcium sulphonates. This technology is characterized by exceptional mechanical stability, high dropping point, high load carrying performance, reduced wear, and excellent resistance to water and corrosion. This technology equals and, in many ways, outperforms other premium, high temperature greases such as lithium complex, aluminium complex and polyurea. NLGI 1 is available for better pumpability requirements.

Foodmax® Grease CAS S2 HS

Foodmax® Grease CAS S 2 HS is a member of a family of technologically advanced greases which have been developed by complexing modified overbased calcium sulfonates. This technology is characterized by exceptional mechanical stability, high dropping point, high load carrying performance, reduced wear, and excellent resistance to water and corrosion. This technology equals and, in many ways, outperforms other premium, high temperature greases such as lithium complex and aluminum complex.

Foodmax® Grease TF-S

Foodmax® Grease TF-S is a synthetic food grade grease containing PTFE. The combination of the synthetic base fluid and added solids reduces the friction to a great extent and will provide lubrication under all circumstances including boundary lubrication. Shows excellent compatibility with elastomers and plastics.

Foodmax® Grease Fluor HT

Foodmax® Grease Fluor HT 2 is a non-flammable white grease developed from a perfluoroalkyl-polyether type oil, with micronised PTFE as thickener and anti-corrosion additive. It is physically and chemically totally inert except for fluorinated solvents and thermal and ionising radiation. All the raw materials used in the manufacturing process appear in the positive list of the FDA (Food and Drugs Administration).

Foodmax® Grease SI

Very adherent silicone grease, designed to provide perfect sealing and regular smooth operation in mono-drive taps. Long lifetime. Perfect water insolubility. Extends the working life and reduces wear of the ceramic disks. Approved by health authorities approval and Water Byelaws Scheme approval per BS-6920.

Foodmax® Assembly Paste

White, non-toxic, grease-like compound with a high solid lubricant content designed for use as an assembly lubricant for lubricating bushes, sliding surfaces, small open plastic or metal gears and anti-seize compound for threaded fasteners. The compound is designed to prevent damage during start up and protect against premature wear during the running-in period.

NLGI: classifying stiffness of a Grease.

NLGI class	Worked penetration penetration number	General consistency
000	445-475	Liquid
00	400-430	Mildly liquid
0	355-385	Semi liquid
1	310-340	Very weak
2	265-295	Weak
3	220-250	Semi solid
4	175-205	Solid
5	130-160	Very solid
6	85-110	Firm

Foodmax® Grease Selection table: behaviour & applications

Miscellaneous food grade

In this section you will find food grade heat transfer fluids. They very often represent a high risk of causing contamination since a leakage may not be discovered for a long time. Also includes general purpose products such as Foodmax® Silicon oils, Foodmax® DDO and Foodmax® Clean.

Foodmax® DDO

Foodmax® DDO is produced from highly refined vegetable based oil and special additives to warrant a trouble free operation when used as a dough divider oil.

Foodmax® HTF 32

Foodmax® HTF (Heat Transfer Fluid) fluids are made with food grade synthetic base fluids. They are formulated to be very thermally and oxidative stable and are further enhanced with proprietary additives that greatly extend their life over normal and other synthetic food grade heat transfer fluids. They provide exceptional performance in a number of food related heat transfer applications.

Foodmax® Silicon

Foodmax® Silicon are special fluids developed to lubricate applications which suffer from high temperatures and where water and other contaminants are found.

Foodmax® Silicon can also be used as heat transfer fluids in circulating systems and hot bath applications.

Characteristics

Foodmax® 	ISO VG	Pour Point °C	Flash Point °C	NSF / InS approvals
Foodmax® DDO	46	6	>260	3H, H1
Foodmax® HTF 32	32		223	H1, HT1
Foodmax® Silicon 50	50	< -50	>300	H1
Foodmax® Silicon 100	100	< -50	>300	H1
Foodmax® Silicon 10000	200	< -50	>300	H1

Foodmax® Clean

Foodmax® Clean is a general purpose cleaner and degreaser formulated from a citrus derivative which is non toxic, biodegradable and InS C1 approved.

Foodmax® Spray

Aerosols are easy to use and allow mechanics to apply lubricants and greases at the right concentration in the correct location.

Foodmax® Multi Spray

Foodmax® Multi Spray is a very adhesive white food grade lubricant in a spray package. The spray contains a food grade synthetic fluid as well as a 4% food grade solid lubricant (PTFE, commonly known as Teflon). Lubrication of chains, conveyors, slides, joints, mould slides, small bearings or any other application which requires a food grade high performance lubricant. Also suitable for textile, paper and graphic arts, plastic and elevator industry. Also provides excellent performance in motorcycle chain lubrication and in high speed go-kart transmission chains.

Foodmax® Easy Spray

Foodmax® Easy Spray is a universal lubricant for use in food processing equipment where incidental contact with food may occur. Suitable for most applications where medium load resistance is required. Foodmax® Easy Spray can be used as a non sticky general lubricant for chains, bearings and slides with low load, hinges and as a cleaning and conserving agent for stainless steel. Additionally Foodmax® Easy Spray can be used as a food grade mould release oil.

Foodmax® Silicon Spray

Foodmax® Silicon Spray is a silicone based, anti-adherent and lubricating fluid with very high temperature resistance. H1 for use in food processing equipment where incidental contact with food may occur. Excellent lubricant for packaging transport lines and for low load applications. Also suitable as anti adherent for any type of equipment, demoulding of all type of plastics and rubbers and surface polisher.

Foodmax® Grease Spray

Foodmax® Grease Spray is a high performance food grade white grease, sticky and water/steam resistant. Suitable for open gears, slides, conveyors, bearings etc. Also suitable as assembly paste. Temperature range -40 to 180 °C. NSF-H1 for the use in food processing equipment where incidental contact with food may occur.

Foodmax® DDO Spray

Foodmax® DDO is produced from highly refined vegetable based oil and special additives to warrant a trouble free operation when used as a dough divider oil.

Foodmax® DWF Spray

Foodmax® DWF is a food grade multi-purpose penetrating lubricant with excellent water displacing properties. It is a non-toxic lubricating, penetrating and de-watering lubricant and is ideal for use on light loaded chains, bearings and slides in food and clean environments. Working temperature -30 °C to 145 °C

Foodmax® Spray Selection Table

Foodmax® 	Chains	Slides	Open Gear	Penetrating oil	General lubrication	Release agent	Dewatering	Anti-corrosion	NSF / InS approvals
Foodmax® Multi Spray									H1
Foodmax® Easy Spray									H1
Foodmax® Silicon Spray									H1
Foodmax® Grease Spray									H1
Foodmax® DDO Spray									H1, 3H
Foodmax® DWF Spray									H1

Refrigeration

The production of food goes hand in hand with the cooling and freezing of the final product and raw materials. Most food production plants are therefore having all sorts refrigeration equipment in place. Matrix Specialty Lubricants offers a large selection of high quality refrigeration lubricants including POE and PAG and special lubricants for ammonia refrigeration. Please check our Coolmax products in the refrigeration fluids brochure or check the website for more details.

Disclaimer

Information presented in this selection table is considered reliable, but conditions and methods of use, which are beyond our control, may modify results. Before adopting our products for commercial use, the user should confirm their suitability. In no case should recommendations or suggestions for the use of our products be understood to sanction violation of any patent.

Viscosities can be related horizontally only. For example, the following oils have similar viscosities: ISO 460, AGMA 7 and SAE GEAR OIL 140. The viscosity/temperature relationships are based on 95 VI oils and are used for mono grade engine oils, gear oils and other 95 VI oils. Crankcase oils and gear oils are based on 100° C viscosity. The "W" grades are classified on low temperature properties. ISO oils and AGMA grades are based on 40° C viscosity.

Glossary of terms

Additive

A chemical added in small quantities to a product to improve certain properties. Among the more common petroleum product additives are: oxidation inhibitors for increasing the product's resistance to oxidation and for lengthening its service life; rust and corrosion inhibitors to protect lubricated surfaces against rusting and corrosion, demulsifiers to promote oil-water, separation, VI improvers to make an oil's viscosity less sensitive to changes in temperature, pour-point depressants to lower the cold temperature fluidity of petroleum products, oiliness agents, anti-wear agents, and EP additives to prevent high friction, wear, or scoring under various conditions of boundary lubrication, detergents and dispersants to maintain cleanliness of lubricated parts, anti-foam agents to reduce foaming tendencies, and tackiness agents to increase the adhesive properties of a lubricant, improve retention, and prevent dripping or spattering.

Anhydrous

Free of water, especially water of crystallization.

Anti-Foam Agent

An additive that causes foam to dissipate more rapidly. It promotes the combination of small bubbles into large bubbles which burst more rapidly.

Anti-Oxidant

A chemical added in small quantities to a petroleum product to increase its oxidative resistance in order to prolong its storage and/or service life. The additive activates in two ways: by combining with the peroxides formed initially by oxidation paralyzing their oxidizing influence, or reacting with a catalyst to coat it with an inert film.

Anti Wear Agent

An additive that minimizes wear caused by metal-to-metal contact by reacting chemically with the metal by forming a film on the surfaces under normal operating conditions.

Acid Number

Also referred to as NEUT or NEUTRALIZATION number: the specific quantity of reagent required to 'neutralize' the acidity or alkalinity of a lube oil sample. In service, the oil will, in time, show increasing acidity as the result of oxidation and, in some cases, additive depletion. Though acidity is not, of itself, necessarily harmful, an increase in acidity may be indicative of oil deterioration, and NEUT number is widely used to evaluate the condition of an oil in service. The most common measurement is ACID NUMBER, the specific quantity of KOH (potassium hydroxide) required to counterbalance the acid characteristics. How high an acid number can be tolerated depends on the oil and the service conditions, and only broad experience with the individual situation can determine such a value.

Auto-Ignition Temperature

Minimum temperature at which a combustible fluid will burst into flame without the assistance of an extraneous ignition source. This temperature is typically several hundred degrees higher than the flash and fire point.

Base Oils

Base stocks or blends used as an inert ingredient in the manufacturing of automotive and industrial lubricants.

Base Stocks

Refined petroleum oils that can either be blended with one another or supplemented with additives to make lubricants.

Base Oil Viscosity in a Grease

Because oil does the lubricating in a grease, and viscosity is the most important property of the lubricant, the viscosity of the base oil needs to be designed correctly for the application.

Boundary Lubrication

A form of lubrication effective in the absence of a full fluid film. Made possible by the inclusion of certain additives in the lubricating oil that prevent excessive friction and scoring by forming a film whose strength is greater than that of oil alone. These additives include oiliness agents, compounded oils, anti-wear agents, and extreme pressure agents.

Carbon Residue

Coked material formed after lubricating oil has been exposed to high temperatures.

Copper Strip Corrosion

Evaluation of a product's tendency to corrode copper or copper alloys. ASTM D130. Test results are based on the matching of corrosion stains.

Corrosion Inhibitor

A lubricant additive for protecting surfaces against chemical attack from contaminants in the lubricant.

Compatibility of a Grease

This is one of the most important grease properties. Whenever two incompatible thickeners are mixed, grease usually becomes soft and runs out of the bearing. When mixing different thickener types, consult supplier on compatibility. Some incompatible thickeners are aluminum and barium soaps, clay and some polyureas.

Consistency

NLGI grade is based on amount of thickener. Consistency describes the stiffness of the grease. NLGI 2 is the most common grade.

Demulsibility

A lubricant's ability to separate from water, an important consideration in the lubricant maintenance of many circulating systems.

Detergent

An additive which chemically neutralizes acidic contaminants in the oil before they become insoluble and fall out of the oil forming sludge. Particles are kept finely divided so that they can remain dispersed throughout the lubricant.

Dropping point

The temperature at which a grease changes from semi-solid to a liquid state under test conditions. It may be considered an indication of the high temperature limitation for application purposes.

Entrainment

Describing a state of an immiscible fluid component. Minute quantities of a fluid (typically water) can be dissolved or absorbed into the oil, but excess quantities can be most harmful to equipment due to the entrainment leaving gaps in the lubricated areas.

Emulsion

A mechanical mixture of two mutually insoluble liquids (such as oil and water).

EP agent

An additive to improve the extreme pressure properties of a lubricant.

Flash Point

Lowest temperature at which the air vapor from a sample of a petroleum product or other combustible fluid will "flash" in the presence of an ignition source. The flash can be seen in the form of a small spark over the liquid.

Fire Point

Lowest temperature at which a combustible fluid will burst into flame in the presence of an extraneous ignition source. Very little additional heat is required to reach the fire point from the flash point.

Foaming

A possible reaction of an oil when mixed with air. This entrained air can result in reduced film strength and performance reduction.

Foam Inhibitor

An additive which causes foam to dissipate more rapidly. It promotes the combination of small bubbles into large bubbles which burst more easily.

Four-Ball Tests

Two test procedures on the same principle. The Four Ball Wear Test is used to determine the relative wear-preventing properties of lubricants operating under boundary lubrication conditions. The Four Ball Extreme Pressure Test is designed to evaluate performance under much higher unit loads.

Hydrocarbons

Compounds of hydrogen and carbon of which petroleum products are examples. Petroleum oils are grouped into two parts: Naphthenic, which possess a high proportion of saturated cyclic molecules; and paraffinic, which possess a low proportion of unsaturated cyclic molecules.

Glossary of terms continued

Hydro Treating

A Gulf patented process used to make lubricant base stocks. In the process, lubricant feedstocks are reacted with hydrogen in the presence of a catalyst at very high temperature (400oC) and pressure (3000 plus psi). The process displaces impurities and unsaturated hydrocarbons.

Hydrodynamic Lubrication

A type of lubrication effected solely by the pumping action developed by the sliding of one surface over another in contact with an oil. Adhesion to the moving surface draws the oil into the high-pressure area between the surfaces, and viscosity retards the tendency to squeeze the oil out. If the pressure developed by this action is sufficient to completely separate the two surfaces, full-fluid-film lubrication is said to prevail.

ISO

International Standard Organization

Load Carrying Ability

Under high-load conditions, high-viscosity base stock is required and usually with an EP additive or solid additive like molybdenum disulfide.

NLGI: classifying stiffness of a Grease

The best way to define the consistency or stiffness of the grease is set out by the NLGI (National Lubricating Grease Institute). A test method defines the following grades according to a level of penetration measured at a temperature of 25 °C. The consistency of the grease will change as soon as the temperature of the application will increase or decrease. When temperature falls below 25 °C, the NLGI grade rises and the grease will appear more stiff.

On the other hand, as soon as the temperature will go beyond 25 °C, the NLGI grade is reduced and the grease becomes less stiff.

Oxidation

A form of chemical deterioration to which all petroleum products are subject to, and involves the addition of oxygen atoms resulting in degradation. It is accelerated by higher temperatures above 25oC, with the rate of oxidation doubling by each 10o increase. With fuels and lubricant oils, oxidation produces sludges, varnishes, gums, and acids, all of which are undesirable.

Oxidation Inhibitor

A chemical added in small quantities to a petroleum product to increase its oxidation resistance in order to prolong its storage and/or service life. The additive activates in two ways: by combining with the peroxides formed initially by oxidation, paralyzing their oxidizing influence, or reacting with a catalyst to coat it with an inert film.

Oil Separation of a Grease

For a grease to be effective, a small amount of oil must separate from the thickener (usually less than 3%).

Pumpability of a Grease

This is an important property when pumping grease in centralized systems at low temperatures. Most common test is Lincoln Ventmeter.

Pour Point

A widely used low temperature flow indicator, depicted as -15oC above the temperature to which a normal liquid petroleum product maintains fluidity. It is a significant factor in cold weather start-up. Paraffinic oils typically have higher pour points due to the formation of wax crystals, while many other lubricants reach their low pour points through an increase in viscosity.

Rust Inhibitor

Alubricant additive for protecting ferrous (iron and steel) components from rusting caused by water contamination or other harmful materials from oil degradation.

Shear Stress

A unit of frictional force overcome in sliding one layer of fluid along another. This is typically measured in pounds per square foot, with pounds and square feet representing the area of contact between the sliding layers.

Shear Stability

Grease needs to maintain its consistency under high shear conditions. The shear stability test measures the softening of grease when sheared for 10,000 or 100,000 double strokes with a grease worker. Loss of less than one NLGI grease grade signifies a stable thickener under high shear conditions.

Sludge

The collective name for contamination in a compressor and on parts bathed by the lubricating oil. This includes decomposition products from the fuel, oil, and particulates from sources external to the compressor.

Solvency

The ability to dissolve into a solution producing a homogeneous physical mixture. The degree of solvency varies along with the rate of dissolution depending on the amount of heat added to the solution.

Synthetic lubricants

Lubricants manufactured by a process, where a chemical conversion or transformation of one complex mixture of molecules into another complex mixture takes place.

Common types of synthetic base oil include: Polyalpha olefins (PAO), Hydrocracked/Hydroisomerized, Unconventional Base Oils (UCBO), Organic Esters, Polyglycols (PAG).

Timken OK load

Measure of the extreme pressure properties of a lubricants.

Thickener for Grease

A grease consists of a base oil, additives and a thickener. There are soap and non-soap thickeners. Each thickener type provides unique characteristics to the grease.

Vapor Pressure

The measure of a liquid's volatility. The higher the pressure at a standard test temperature, the more volatile the sample, and the more readily it will evaporate.

Varnish

A deposit resulting from oxidation and polymerization of fuels and lubricants. Similar to but softer than lacquer.

Viscosity

Measure of a fluid's resistance to flow. This is typically measured as the time required for a standard quantity of fluid at a certain temperature to flow through a standard orifice. The higher the value, the more viscous the fluid. Viscosity varies inversely with temperature so the measurements are always expressed together. Tests are typically conducted at 40oC and 100oC.

Viscosity Index

The measure of the rate of change of viscosity with temperature. Heating tends to make lubricants thinner, cooling makes them thicker. The higher a VI is on a particular fluid, the less of a change in viscosity there will be over a given temperature range. In determining the VI, two temperatures of viscosity are taken, one at 40oC and the other at 100oC.

Volatility

The property of a liquid that defines its evaporation characteristics. Of two liquids, the more volatile one will boil at a lower temperature and will evaporate faster when both liquids are at the same temperature. The volatility of petroleum products can be evaluated with tests for flash point, vapor pressure, distillation, and evaporation rate.

Water Resistance

Water washout test measures ability of a thickener to remain intact in water. Water spray-off measures a thickener to remain in presence of water spray. These tests measure percentage removed.
